

Python String Functions Cheat Sheet

Basic String Methods

- `len()`: Returns the length of the string
- `str()`: Converts another type to a string
- `type()`: Checks the type of a variable

Case and Formatting

- `upper()`: Converts to uppercase
- `lower()`: Converts to lowercase
- `title()`: Capitalizes the first letter of each word
- `capitalize()`: Capitalizes the first letter of the string
- `swapcase()`: Swaps uppercase and lowercase letters

Search and Replace

- `find(sub)`: Returns index of first occurrence (or -1 if not found)
- `index(sub)`: Like `find()`, but raises an error if not found
- `count(sub)`: Counts occurrences of a substring
- `replace(old, new)`: Replaces substring with another
- `startswith(prefix)`: Checks if string starts with prefix
- `endswith(suffix)`: Checks if string ends with suffix

Splitting and Joining

- `split()`: Splits string by spaces or a given separator
- `splitlines()`: Splits string at line breaks
- `join(iterable)`: Joins iterable of strings into one string

Trimming and Justifying

- `strip()`: Removes spaces from both ends
- `lstrip()`: Removes spaces from the left
- `rstrip()`: Removes spaces from the right
- `center(width)`: Centers string in a field of given width
- `ljust(width)`: Left-justifies string

- `rjust(width)`: Right-justifies string

Character Checks (Boolean)

- `isalnum()`: Checks if string is alphanumeric
- `isalpha()`: Checks if string contains only letters
- `isdigit()`: Checks if string contains only digits
- `islower()`: Checks if all characters are lowercase
- `isupper()`: Checks if all characters are uppercase
- `isspace()`: Checks if string contains only whitespace
- `istitle()`: Checks if string is titlecased
