

Python Tuple Methods Cheat Sheet

Tuples in Python are immutable, meaning their elements cannot be changed once created. They have only two built-in methods, but several useful operations can be performed on them.

Tuple Methods

- `count(value)`: Returns the number of times a value appears in the tuple
- `index(value)`: Returns the first index of a value (raises `ValueError` if not found)

Common Tuple Operations

- `len(tuple)`: Get number of elements in the tuple
- `max(tuple)`: Get the largest element
- `min(tuple)`: Get the smallest element
- `sum(tuple)`: Get the sum of all numeric elements
- `sorted(tuple)`: Returns a sorted list of elements
- `tuple(iterable)`: Converts an iterable into a tuple
- `in` keyword: Checks if a value exists in the tuple
- Tuple unpacking: Assigns tuple values to variables, e.g., `a, b, c = (1, 2, 3)`

Example Code

```
t = (1, 2, 2, 3, 4)
print(t.count(2))      # 2
print(t.index(3))      # 3
print(len(t))          # 5
print(sum(t))          # 12
print(sorted(t))       # [1, 2, 2, 3, 4]
a, b, c, d, e = t
print(a, e)            # 1 4
```
